

PRELIMINARY DATA: Current Delta Hydrologic Conditions

Last updated: *December 23, 2025*

Operational and Regulatory Conditions

DCC gates are the current controlling factor. See most recent weekly outlook for more information.

Current Conditions

Most recent inflow at Freeport in the Sacramento River and Vernalis in the San Joaquin River is 32,753 and 5,784 cfs respectively. Most recent 1-day, 5-day, and 14-day OMRI measurements were -6,428, -5,551, and -3,587 respectively, and most recent export data were 3,531 for Jones Pumping Plant and 5,562 for Henry O. Banks Pumping Plant.

Figure 1: Operations and Action Summary, WY 2026. The colors in the OMRI plot indicate different types of triggers (see Table 1). OMRI data calculated by SacPAS, Freeport (FPT) and Vernalis (VNS) flow data from CDEC, and CVP (TRP) and SWP (HRO) exports data from CDEC.

Table 1: Summary of Actions and Triggers, WY 2026

Label	Action	Date Triggered	Date Implemented	Number Days Implemented	Regulation
1	DCC Gate Closure	10/28/2025	10/30/2025	Ongoing	DCC gates

Zone of Influence

The Zone of Influence (ZOI) analysis served as a Line of Evidence for comparing alternative actions in the Long Term Operations EIS. This analysis evaluated the spatial extent of hydrologic alteration resulting from pumping under varying Old and Middle River flow conditions and Sacramento-San Joaquin river inflow conditions. This analysis was adapted for the assessment by focusing on a single alternative, Alt2woTUCPDeltaVa, which served as the proposed action in the 2024 Record of Decision, and binned maps into 1 of 9 categories based on low, medium, and high inflows from the Sacramento and San Joaquin flow. In general, changes in channel length across OMR levels may correlate with entrainment risk, where larger increases in channel length from more positive to more negative OMR represent greater entrainment risk.

Current conditions were queried from most recent Freeport flow data on the Sacramento River and Vernalis flow data on the San Joaquin river from [SacPAS](#). Forecasted flows were queried from short range deterministic flows provided by the [California Nevada River Forecast Center](#).

Current conditions at Freeport and Vernalis indicate that delta hydrology falls within the ‘hihi’ category. Forecasted conditions averaged across the next 7 days falls within the ‘hihi’ category.

The altered channel length for the current “hihi” hydrology is 99 kilometers (km) for an OMR of -2000 and 114 km for an OMR of <-5500. The altered channel length for forecasted “hihi” hydrology is 99 kilometers (km) for an OMR of -2000 and 114 km for an OMR of <-5500.

Change in altered channel length between OMR levels is 15 km for current conditions and 15 km for forecasted conditions indicating that ZOI impacts across OMR scenarios would decrease under forecasted hydrology.

Current Flow

Forecasted Flow
